.NET and ObjectARX AutoCAD utilizes the.NET Framework for several tasks. For example, AutoCAD can read and write objects to the Microsoft Excel Application Object Model (AOM) (SOA). This allows AutoCAD to share drawing information within Excel, as well as to utilize Excel-based calculation and reporting features within AutoCAD. AutoCAD can also be scripted and written in C#. This allows creation of customization tools based on C#-based user-interface elements and scripting language. In addition to Microsoft's Windows.NET Framework, AutoCAD also supports ObjectARX, an object-oriented programming environment for the

AutoCAD R14, R15, and R16 operating systems. ObjectARX is based on the C++ class library introduced in AutoCAD 2004. LISP AutoCAD LISP is a registered trademark of Autodesk, Inc. LISP is an imperative, procedural programming language developed by Autodesk to program AutoCAD and also extends AutoCAD functionality to support application-specific and third-party workflows. LISP also provides a visual development environment where the user can write scripts, macros, and procedures directly in the drawing window. Visual LISP (VLISP) is the next generation of LISP and is now part of AutoCAD LT and AutoCAD 2010. It is a visual programming environment where users can easily develop applications by creating commands and forms as if they were drawing. The user can save these commands and forms as scripts, macros, and procedures. Visual LISP is suitable for both graphic and non-graphic applications. Visual LISP has been released as part of AutoCAD LT. Visual LISP is part of the Autodesk Design Suite. VBA AutoCAD supports the Microsoft Visual Basic for Applications (VBA) macro language, which allows the user to automate tasks in the

---

AutoCAD environment. Macro's can be written in the same language as VBScript, but are stored as an "add-in" file (.CAB) and are installed in the AutoCAD application folder. The resulting file can then be executed from the same place that the user can execute other add-ins (.CAB) or script (.SCR) files. VBA also supports debugging within the AutoCAD environment. Q: To use "mug" and "cup" interchangeably Is there any difference between the usage of "mug" and "cup" when it comes to transferring liquids? If it is not, then which one should be used more often? A: As you are probably aware, there are two main uses for the word 'mug' to refer to a container for drinking: to carry a drink in, using a glass or cup to drink from a mug A mug is simply a glass or cup used for drinking. As you can probably tell from its etymology, the word 'mug' has nothing to do with the colour of the vessel. In the US, we tend to use 'cup' more often in the second sense - 'a cup' being used to mean 'a glass or cup' by itself, while 'mug' in this context often refers to a piece

of equipment used for drinking. The British also use 'cup' in this sense, though we tend to use 'glass' more often: a glass for drinking from a mug (for carrying drinks, usually a cafetière or coffee-pot, though often smaller and finer) Q: C# check if specific index in array is null I am iterating through some data and want to set a value to true when an index in an array is null. I am not sure what the correct way of doing this is. This is what I have been using to check if a value is null but it always returns false and my array contains null values. if (row.RowType == DataRowType.Header) { if (row["CustEmail"] == null) { alert.InnerHtml
