## Cloudfogger

Cloudfogger is a simple, yet powerful and easy to use application to protect your cloud storage. All it needs is that you upload content that is to be protected to a folder, and then you'll be able to share it with other people. This app can be used to protect any kind of content. You can protect any kind of file, folder, or even your storage in the cloud. Cloudfogger needs to be launched before it can encrypt the content. Features: - Instantly encrypts any content in your folder. - Protects any type of file, folder, or even your storage in the cloud. - Generates a contextual menu item that allows you to easily share files. - On-demand encryption can be done. - Currently supports SSL/TLS and can be used for encrypting both cloud storage and on-premises storage. - A configurable password can be set. - Supports previewing encrypted files. - It's one of the easiest ways to encrypt your files without giving away access to them. - No size limit for the content to be protected. - It's suitable for both home and office use. - Since Cloudfogger encrypts your data in the cloud, it can be used with any cloud storage. - Requires no third-party add-ons or any special system requirements. - No files are deleted after encryption. - Safe and secure with no risk. - Create contextual menu entries and share files with other people. - Option to change the size of a folder you want to protect. - Provides a simple interface and is very easy to use. - The encryption is done locally on your PC and the files are then uploaded to the cloud. - No downloads or additional add-ons are needed. - File size limit, or no limit for the content to be protected. - Supports SSL/TLS encryption for encrypting cloud storage and on-premises storage. - Can be used for protecting any kind of content. ## What's New In Cloudfogger?

Cloudfogger is a simple solution for people who want to secure their cloud files and want to share them with only a select few people. After choosing a target folder, you can simply “fog” any file to your cloud space. In case the file is changed after the fogging process, Cloudfogger sends out an email to notify the intended recipient. Cloudfogger uses an easy to use context menu entry to quickly “fog” any file or folder to your cloud space. Files can also be copied from the target folder to the protected folder, resulting in their automatic encryption. The application does not track target folders, but only looks to the provided path for the directory name. Moving files around, mostly while the application is not running, either leaves files vulnerable or makes them completely inaccessible, with the application unable to do anything in this regard. If the application is not running, files will be temporarily moved to a protected folder. The only limitation of the application is the number of targets.
