Users can write their code directly into the app Besides allowing for drag and drop, Quick Batch File Compiler also lets its users write and develop the.bat file source code within the app, as if it were a text editor. While the "Source" tab is where the users will spend most of their time, the "Version Info" tab next to it grants the ability to write specific version info into the executable file, the users being fully able to designate a company name, a product name, its legal copyrights, and trademarks, and even a product and file version — among others. The "Embedded Files" is also intriguing in its own way: you can pick and choose an icon for the executable file, and even include additional files into the final product. The executable can behave to your liking Under the "Options" menu, the user is given a choice between the standard, newer JIT Console Application, and the legacy Console Application modes. There's also a third choice, in the Ghost Application executable, which is supposed to run in the background and not bother the user with the windows that may pop up while executing a.bat file. For instance, this makes it possible for a script to be run without the current user knowing about it. What's more, the content of the.exe can be encrypted so that it cannot be reverse-engineered nor
