There are a couple of things you need to consider. First, with data being written to disk you can't expect to always have the best possible performance. This is particularly true in a multi-user environment where you will have differing amounts of I/O bandwidth. Second, doing reads is often faster. Hence, "do the reads first", and then do the writes. Finally, time is cheap. If you need to run things very fast, you can write a simple program that does a bunch of reads and writes and time the result. It won't be nearly as accurate, but it's easy to write and will tell you if you're consistently faster than the slow write and read approach, or if you should take this approach. Q: How to get the first and last index of an object array in C I have an array (sorted) of objects, which I want to loop over. Object[] a = new Object[] {1,2,3,4,5,6,7,8,9,10}; I only want to get the first and last element. They will always have equal indexes, but in fact not all objects are equal. I thought about using a for loop with modulo variables, but I want to use an if statement inside the loop, otherwise I'd have a list of flags (the elements before and after the current element) where the first element would be one less than the last element, or vice versa. A: You could use this code that will give you the first and last element in the array, and that removes the need for your loops (which will get messy with the 'last' element having an index of -1) int first = (int)a.GetFirst(); int last = (int)a.GetLast(); Supergirl's Carmine DiNadi, Black Lightning's Cress Williams, and Power's Anna Diop joined the season finale of Marvel's Cloak & Dagger on Thursday's episode of The CW's flagship series. Additional cast members included the show's
